

Discrete Structures: A Repeatable Lab

Aug. 27 setup review

COMSC 2043

The lesson
Trustworthy reasoning needs a trustworthy, inspectable setup.

Read the real path

- 1 Open the Canvas module.
- 2 Read the setup script.
- 3 Inspect the downloaded file and its location.
- 4 Run the supported command for your operating system.

Windows and macOS

Windows

- PowerShell
- 'cd' to Downloads
- 'ls' and tab completion

macOS

- Terminal
- documented 'uname' checks
- Python/Homebrew checks

Evidence, not theater

Keep a small receipt:

Expected — what should happen?

Actual — what did the machine say?

Tried — what did you already change or check?

What to carry forward

- Setup output is evidence about this environment.
- Pair work helps, but preserve your own trail.
- A failure is a useful boundary when recorded precisely.
- Next: use the working environment for containers and repeatability.

Your next move

Run the current Canvas setup/readiness path, save the report, and write one precise failure receipt if it does not finish.
